

Python Notes

Python

Python is a high-level, general-purpose programming language known for readable syntax and a large ecosystem of libraries.

Variables and Data Types

Python variables can reference values such as integers, floating-point numbers, strings, booleans, lists, tuples, sets, and dictionaries.

Functions

Functions are reusable blocks of code. They can accept parameters and return values.

Object-Oriented Programming

Python supports object-oriented programming through classes and objects. Classes can contain attributes and methods.

File Handling

Python can create, read, write, and append files using the built-in open function. The with statement is commonly used so files are closed automatically.

Exceptions

Exception handling uses try, except, else, and finally blocks to handle runtime errors without unnecessarily terminating a program.
